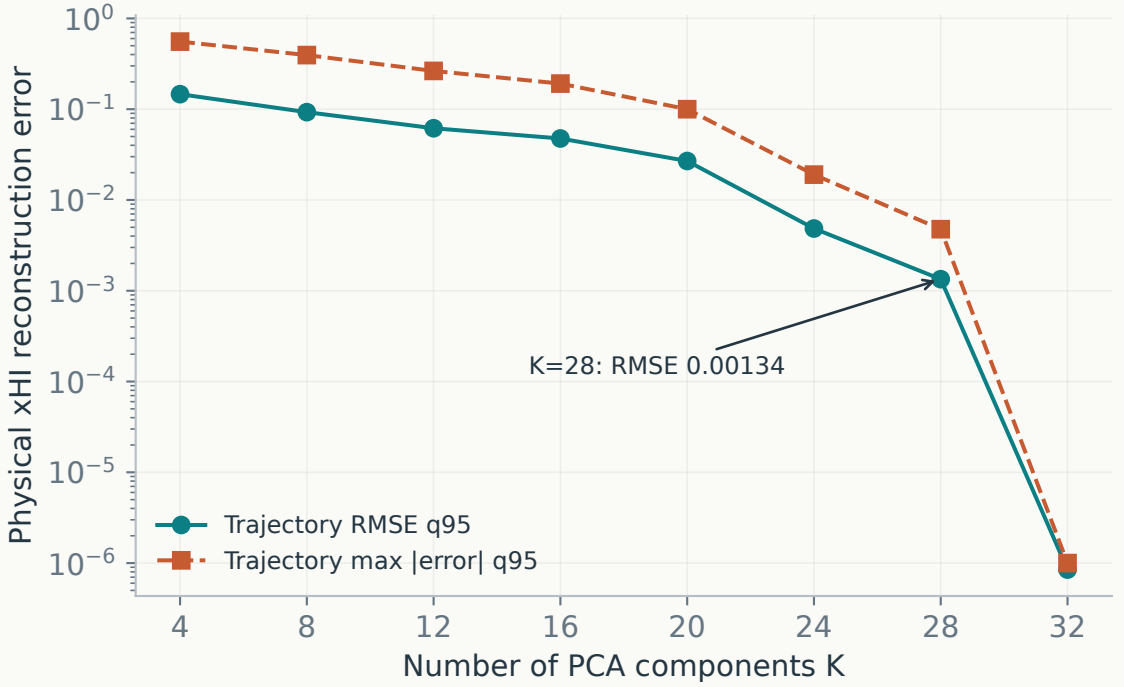
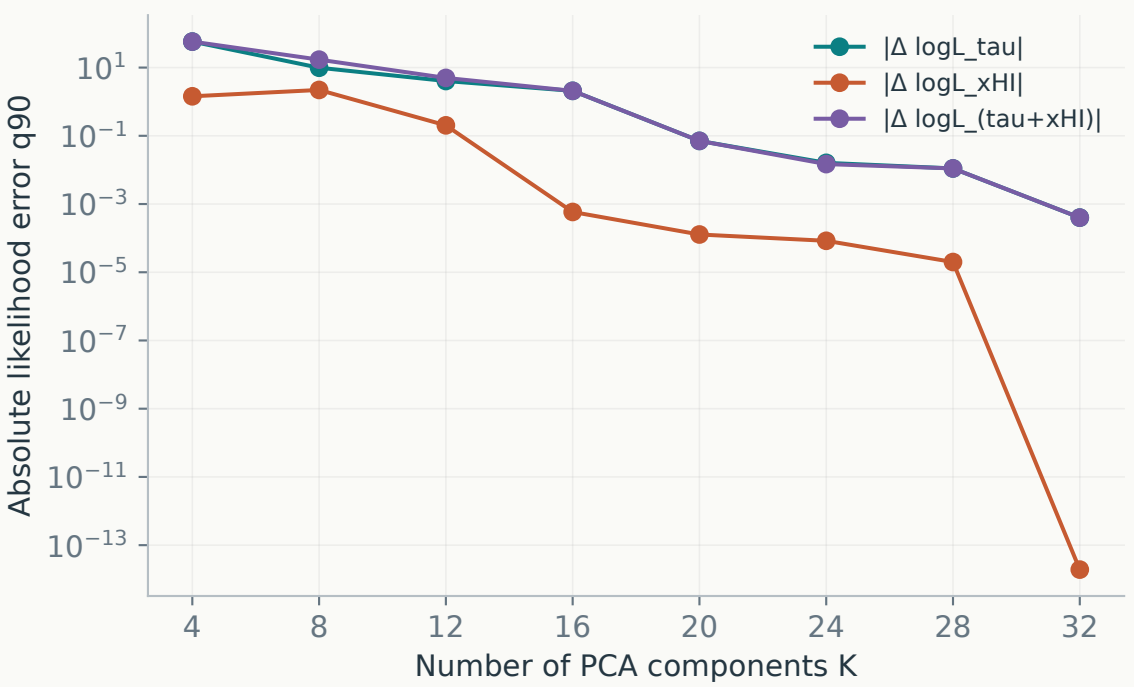
04 | How much PCA compression is plausible?

Logit PCA fitted to 3,372 Train-positive histories. Exact coefficients; these are in-sample reconstruction errors, not NN errors.





K=28 reduces 32 coefficients to 28 (12.5%). Independent Validation is still required before choosing a decoder.

History errors: all 3,372 positives. Likelihood errors: the same fixed 256-point subset, using original postprocessing; epsilon=1e−6.
